## Bank Liabilities Survey

 Survey results | 2018 Q4

## Bank Liabilities Survey

 2018 Q4Developments in lenders' balance sheets are of key interest to the Bank of England in its assessment of economic conditions. Changes in the price, quantity and composition of lenders' funding may affect their willingness or ability to lend, and the price of lending. The aim of this quarterly survey of banks and building society lenders is to improve understanding of the role of lenders' liabilities and capital in driving credit and monetary conditions. Lenders are asked about the past three months and the coming three months. The survey covers developments in the volume and price of bank funding; developments in the loss-absorbing capacity of banks as determined by their capital positions; and developments in the internal price charged to business units within individual banks to fund the flow of new loans, sometimes referred to as the 'transfer price'.

This report presents the results of the 2018 Q4 survey. It was conducted between 19 November and 7 December 2018.

Additional background information on the survey can be found in the 2013 Q1 Quarterly Bulletin article 'The Bank of England Bank Liabilities Survey'.

This report, covering the results of the 2018 Q4 survey, and copies of the questionnaires are available on the Bank's website at www.bankofengland.co.uk/bank-liabilities-survey/2018/2018-q4.

The 2019 Q1 Bank Liabilities Survey will be published on 18 April 2019.

## BANK OF ENGLAND

## Bank Liabilities Survey

## 2018 Q4

## Funding

- UK banks and building societies reported that their total funding volumes increased significantly in the three months to end-November 2018 (Q4). Within the total, 'other' funding - which includes wholesale debt funding, wholesale deposits and funding via central bank operations - was reported to have increased significantly. Retail deposit funding was also reported to have increased (Chart 1). Lenders expected total funding volumes to remain unchanged in the three months to end-February 2019 (Q1), although 'other' funding was expected to increase significantly.
- Spreads - relative to appropriate reference rates - on 'other' funding were reported to have increased significantly in Q4, while spreads on retail deposits were reported to have increased only slightly (Chart 2). Lenders expected spreads on 'other' funding to increase significantly and retail deposits spreads to increase slightly over the next quarter.
- Lenders reported that the supply of deposits from households remained unchanged in Q4, and was expected to decrease over the next quarter. The supply of deposits from private non-financial corporates was reported to have increased slightly, and was expected to increase slightly in Q1 (Chart 3).
- The proportion of wholesale market funding accounted for by long-term instruments was reported to have increased significantly in Q4 and was expected to increase significantly again in Q1.
- Investor demand for banks' wholesale debt was reported to have decreased significantly in Q4 and was expected to decrease significantly again in Q1 (Chart 4).

## Capital

- The average cost of capital was reported to have increased significantly in Q 4 and was expected to increase significantly again in Q1.
- Lenders reported that their total capital levels decreased slightly in Q4, and was expected to remain unchanged in Q4.

## Transfer pricing

- Lenders reported that the internal price charged to business units to fund the flow of new loans (the 'transfer' price) had increased significantly in Q4 (Chart 5). This was reported to have been driven by a significant increase in wholesale funding spreads (Chart 6). Lenders expected a significant increase in the transfer price in Q1. results are based on lenders' own responses to the survey. They do not necessarily reflect the Bank's views on developments in bank liabilities. To calculate aggregate results, each lender is assigned a score based on their response. Lenders who report that conditions have changed 'a lot' are assigned twice the score of those who report that conditions have changed 'a little'. These scores are then weighted by lenders' market shares. The results are analysed by calculating 'net percentage
balances' - the difference between the weighted balance of lenders reporting that, for example, demand was higher/lower or terms and conditions were tighter/looser. The net percentage balances are scaled to lie between $\pm 100$.

This report and copies of the questionnaires are available on the Bank's website at www.bankofengland.co.uk/bank-liabilities-survey/2018/2018-q4.

Chart 1 Funding volumes ${ }^{(\mathrm{a})(\mathrm{b})}$

Q1 Q1 Q1 Q1 Q1 Q1Q1 Q1 Q1 Q1 Q1 Q1 Q1 Q1 Q1 Q1 Q1 Q1
$\begin{array}{llllllllll}201415 & 16 & 17 & 1819 & 201415 & 16 & 17 & 1819 & 2014 & 15 \\ 16 & 17 & 1819\end{array}$
(a) Net percentage balances are calculated by weighting together the responses of those lenders who answered the question. The blue bars show the responses over the previous three months. The red diamonds show the expectations over the next three months. Expectations balances have been moved forward one quarter so that they can be compared with the actual outturns in the following quarter.
(b) Question: 'How have funding volumes changed?'
(c) A positive balance indicates an increase in funding volumes.

## Chart 3 Supply of deposits(a)(b)

(a) See footnote (a) to Chart 1 .
(b) Question: 'How has the supply of deposits from the following sources changed?'.
(c) A positive balance indicates an increase in the supply of deposits.

## Chart 5 Transfer prices(a)(b)

(a) See footnote (a) to Chart 1.
(b) Question: 'How has the marginal absolute cost of providing funds to business units changed (sometimes referred to as the 'transfer price')??
(c) A positive balance indicates an increase in transfer prices.

Chart 2 Funding spreads ${ }^{(a)(b)}$

(a) See footnote (a) to Chart 1
(b) Question: 'How has the average cost of funding changed?'
(c) A positive balance indicates an increase in funding spreads.

Chart 4 Investors demand for UK bank debt ${ }^{(a)(b)}$

(a) See footnote (a) to Chart 1.
(b) 'How has demand for wholesale debt from the following investors changed?'
(c) A positive balance indicates an increase in investors' demand for banks' wholesale debt.

Chart 6 Factors affecting transfer prices ${ }^{(\mathrm{a})(\mathrm{b})}$

[^0]
## Annex 1

## Definitions and terminology

This annex provides further details of the questions referred to in the main text.

## Terminology and general definitions

The following terms are used within the report:

- Cost - the cost to the issuing bank of raising money via the specified form of funding.
- Demand factor - a factor that influences a bank's need or desire for a particular volume of funding or capital, holding constant any supply factors.(1) These factors include price terms, such as the interest rate paid, spread charged or yield; non-price terms or market liquidity; and regulatory factors.
- Supply factors - these typically include market access (ie whether markets are open or shut to issuers of debt) and investor demand in the case of wholesale debt finance or capital, as well as changing supply, unrelated to changes in prices, on the part of depositors for retail deposits.

## Section 1 - Funding

This section refers to the following broad funding types:

- Total funding - all wholesale and retail funding.
- Retail funding - funding raised by banks in the form of deposits from households and private non-financial corporations (PNFCs).
- Other funding - funding in wholesale public debt capital markets, private placement markets and directly from central bank operations.

It also refers to the following funding instruments:

## Short-term funding

- Certificate of deposit - a time deposit, with maturity of less than 12 months, in the form of a promissory note that is issued by banks and can be traded in secondary markets.
- Commercial paper - a discount instrument security with maturity of less than 12 months, which can be traded in secondary markets.
- Short-term repo/securities lending - funding raised via the sale and subsequent repurchase of a security or similar transaction, with term of less than 12 months.
- Unsecured borrowing including deposits from other financial companies (OFCs) and interbank deposits - funding raised via deposits placed by other financial corporations and other banks.

## Long-term funding

- Long-term repo/securities lending - funding raised via the sale and subsequent repurchase of a security or similar transaction, with term of greater than 12 months.
- Structured products: structured notes - debt instruments based on derivatives which pay coupons and a final redemption value linked to asset prices.
- Structured products: other - other structured debt instruments whose payout or structure is related to another market indicator or asset price.
- Senior unsecured debt - debt securities issued by banks that pay a coupon, along with a final redemption payment.
- Asset-backed securities - debt securities issued by special purpose vehicles, but ultimately 'sponsored' by banks (or other asset originators), that pay a coupon along with a final redemption payment. The security is backed by, and cash flows come from, assets such as residential mortgage loans, commercial mortgage loans or credit card receivables.
- Covered bonds - debt securities issued by banks that pay a coupon, along with a final redemption payment. The security has an associated 'cover pool' of assets, such that the investor has dual recourse to both the issuer and the 'cover pool'.

[^1]
## Section 2 - Capital

The following terms are used within this section:

- Total capital - the total level of capital.
- Cost of capital - the average cost of capital to the issuing institution.
- Common equity Tier 1 capital - paid-up share capital/common stock (issued and fully paid ordinary shares/common stock) and disclosed reserves created or increased by appropriations of retained earnings or other surplus (for example, share premiums, retained profit, general reserves and legal reserves).
- Additional Tier 1 capital - going concern capital that is not included in common equity Tier 1 (for example, perpetual non-cumulative preference shares).
- Tier 2 capital — subordinated instruments that meet the criteria for Tier 2 (and not Tier 1) capital and certain loan loss provision.

This section refers to how various factors might affect a bank's actual and desired level of capital. These factors should be interpreted as follows:

## Direct effects

- Direct effects of profits, losses, deductions and charges (UK-specific/non-UK specific) - how the balance of profits, losses, deductions and charges have affected the total level of capital. Deductions are defined as regulatory changes to the definition of capital: for example if a regulator defined capital more narrowly, this would reduce a bank's total capital. The contribution of such factors is identified within the United Kingdom and outside the United Kingdom.

## Factors that have affected banks' demand for capital

- Changing economic outlook - if a bank expects the economic outlook to deteriorate then it might want to hold a higher level of total capital.
- Strategic decisions to increase/reduce risk - strategic decisions to change the size of a bank's capital buffer above the regulatory requirement, eg if a bank decided to hold a larger capital buffer it would require more capital.
- Regulatory drivers - if regulatory authorities increased required capital levels then a bank may need to raise more capital.
- Changes in size of balance sheet - if a bank expects the size of its balance sheet to increase then it might want to hold a higher level of capital.
- Changes in riskiness of assets - this captures changes to the riskiness of assets, or their risk weighting. If regulatory risk weightings were increased then a bank might need to increase its level of capital. Additionally if a bank chose to hold riskier assets, its demand for capital might increase.

## Supply factors

- Market conditions - covers the effects of market access and investor demand.
- Investor pressure to change volume of capital - changes due to investor concerns about the ability of the respondent to absorb losses.

The section also refers to how various factors might affect the composition of a bank's capital. This question asks about whether economic conditions, strategic decisions to change the mix of capital, regulatory drivers, market conditions or investor demand have contributed positively or negatively to the proportion of total capital accounted for by additional Tier 1 and Tier 2 capital, as opposed to common equity Tier 1 capital.

## Section 3 - Transfer pricing

The following terms are used within this section:

- Average absolute cost - this can be interpreted as the cost to a bank of funding the stock of loans.
- Marginal absolute cost - this can be interpreted as the cost of funding the flow of new loans, rather than the average cost of funding the stock of existing loans. This is sometimes referred to as the 'transfer price'.
- Swaps or reference rates - the transfer price can typically be broken down into the spreads on selected debt instruments, the reference rates to which those spreads are quoted, and the cost of swapping fixed and floating-rate payments. This question identifies the contribution to the transfer price from the latter two.

## Annex 2 <br> Bank Liabilities Survey questionnaire results

To calculate aggregate results, each lender is assigned a score based on their response. Lenders who report that funding conditions have changed 'a lot' are assigned twice the score of those who report that conditions have changed 'a little'. These scores are then weighted by lenders' market shares. The results are analysed by calculating 'net percentage balances' - the difference between the weighted balance of lenders reporting that, for example, funding volumes had increased/decreased. The net percentage balances are scaled to lie between $\pm 100$. This annex reports the net percentage balance of respondents for each question in the questionnaire.

Positive balances indicate that banks, on balance, reported/expected volumes or proportions of funding to be higher than over the previous/current three-month period; demand or supply factors to have contributed positively to volumes; or spreads to have increased relative to the previous/current three-month period (ie become more costly).

Where the survey balances are discussed, descriptions of a 'significant' change refer to a net percentage balance greater than 20 in absolute terms, and a 'slight' change refers to a net percentage balance of between 5 and 10 in absolute terms. Survey balances between 0 and 5 in absolute terms are described as unchanged.

The first Bank Liabilities Survey was conducted in 2012 Q4. A full set of results is available in Excel on the Bank's website at www.bankofengland.co.uk/bank-liabilities-survey/2018/2018-q4.

## 3 Factors contributing to changes in total capital:

Direct effects on total capital
Direct effects of profits, losses, deductions and
charges (UK-specific)
Direct effects of profits, losses, deductions and
charges (non-UK specific)

Factors that have affected demand for capital
Changing economic outlook
Strategic decisions to increase/reduce risk

Regulatory drivers

Changes in size of balance sheet

Changes in riskiness of assets

## Supply factors

Market conditions
Investor pressure to change volume of capital

4 At what approximate frequency do you currently update the marginal absolute cost of providing funds to business units (sometimes referred to as the 'transfer price')? ${ }^{(\mathrm{h})}$
$\begin{array}{llllllllllllllllllllllll}\text { Frequency of transfer price update (days) } & & \text { Past three months } & & 24.0 & 20.9 & 24.1 & 17.9 & 25.4 & 19.4 & 14.9 & 22.7 & 21.9 & 21.8 & 22.1 & 21.8\end{array}$

* Data are unpublished for this question as too few responses were received.
(a) Net percentage balances are calculated by weighting together the responses of those banks who answered the question by their market shares. Positive balances indicate that banks, on balance, reported/expected volumes or proportions of funding to be higher than over the previous/current three-month period; demand or supply factors to have contributed positively to volumes; or spreads to have increased relative to the previous/current three-month period (ie become more costly).
(b) A positive balance indicates an increase in volumes.
(c) A positive balance indicates an increase in cost.
(d) A positive balance indicates a positive contribution to volumes from the selected factor.
(e) A positive balance indicates an increase in the proportion of new issuance accounted for by private issuance/long-term issuance/funding instrument.
(f) A positive balance indicates an increase in investors' demand for banks' wholesale debt.
(g) A positive balance indicates an increase in issuance denominated in the selected currency.
(h) Unlike the other questions in this survey, banks were asked to select the frequency at which they updated their transfer price. This was converted into a number of days. Then a weighted average response, based on lenders' market shares, was calculated.

[^0]:    (a) See footnote (a) to Chart 1.
    (b) Question: 'Factors affecting the marginal absolute cost of providing funds to business units
    (sometimes referred to as the 'transfer price')'.
    (c) A positive balance indicates a positive contribution to the transfer price

[^1]:    (1) The options specified in the survey vary by question, although respondents have the option to include additional comments where relevant.
