

A Smarter way to forecast

Ørjan Robstad

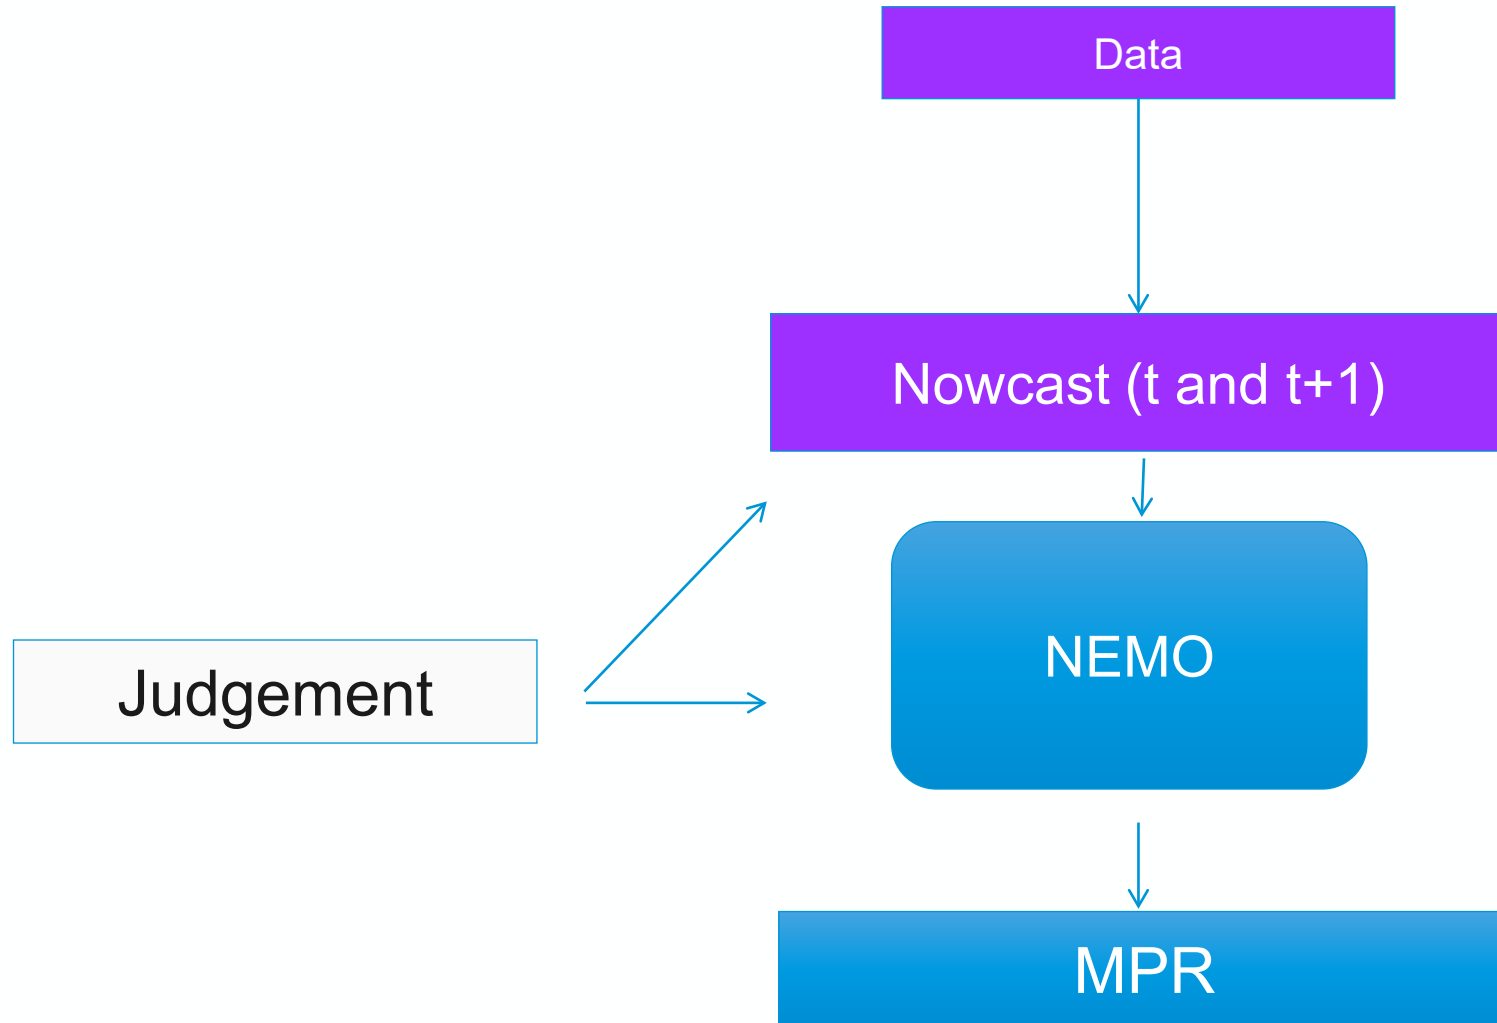

Norges Bank

Plan for the talk

- What is SMART
- SMART in practice
- Going forward

We follow a core model approach

Motivation for the SMART-project

- Improve forecasting process
 - Make sure we use «good» models
 - Easy to test and add new models
 - More - or less automatized system (timesaving)
- Archive and availability
 - Models and data used in policy processes

What is SMART?

- Infrastructure for storing real-time data and model projections
 - For internal- and potentially external accessibility
 - Real-time data base
- Model system of the Bank's empirical models
 - Model averaging based on forecast performance
 - For all key macroeconomic variables
 - For the full forecast horizon

What is SMART?

Database

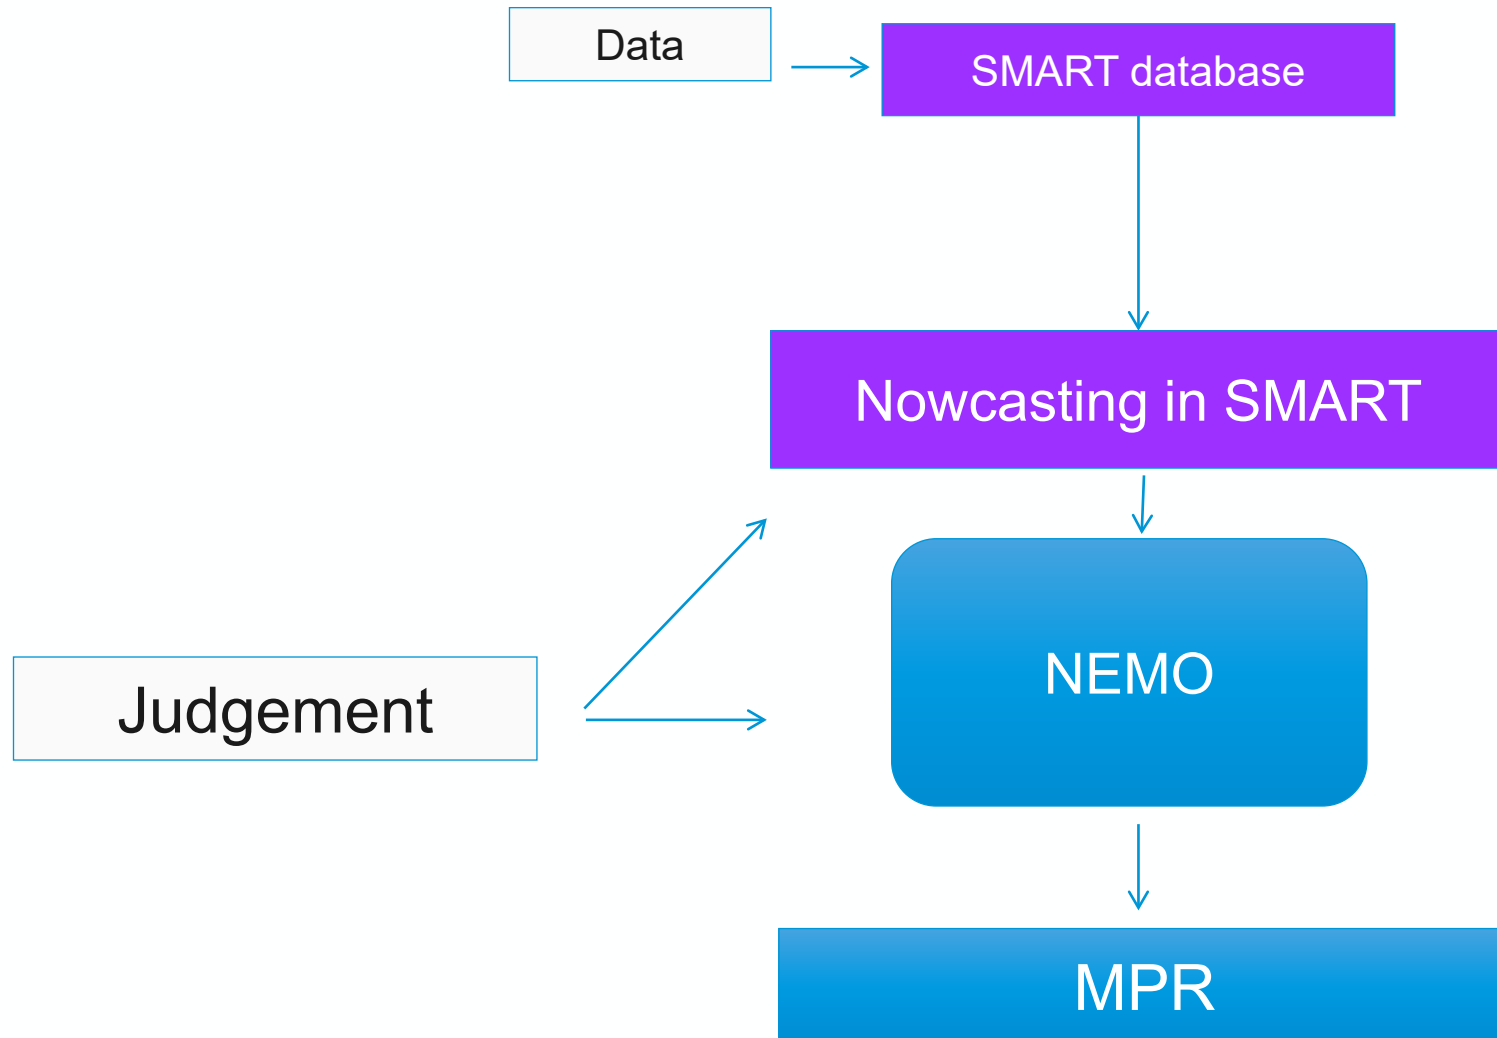

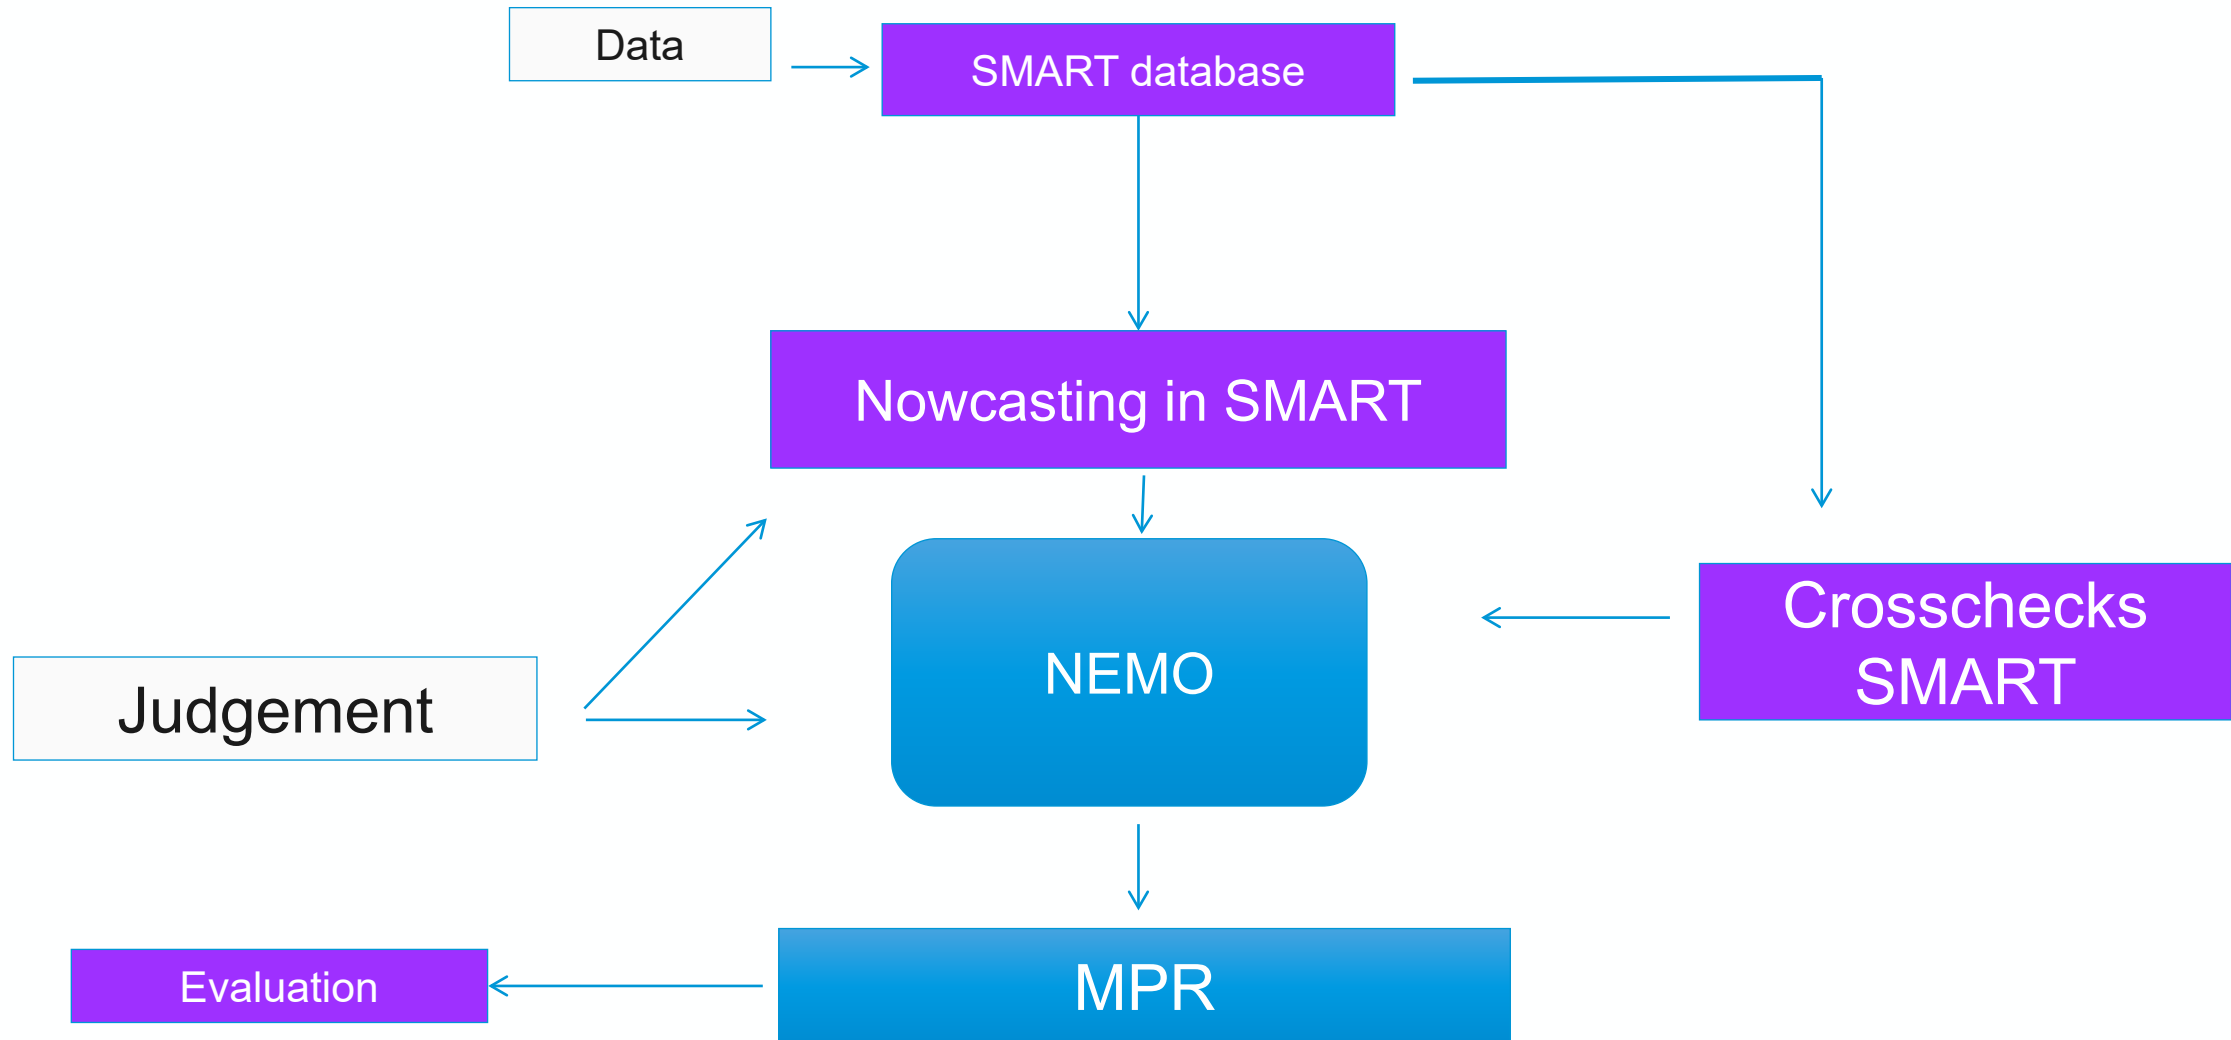

Figure 3: Real-time vintages of real GDP for mainland Norway. Seasonally adjusted. In billions of NOK. 1978Q1-2022Q4

- Database with models and data
 - Including vintages and release calendar
- Model Toolbox
 - Estimating
 - Forecasting
 - Evaluation in real time
 - Combining

Fully integrated into our forecasting routines

Fully integrated into our forecasting routines

Types of models we use in SMART

Univariate models

(B)VAR models

Factor models

State space models

Single equation
models (ECM)

Weighting of models

Trimming
Remove the worst
models

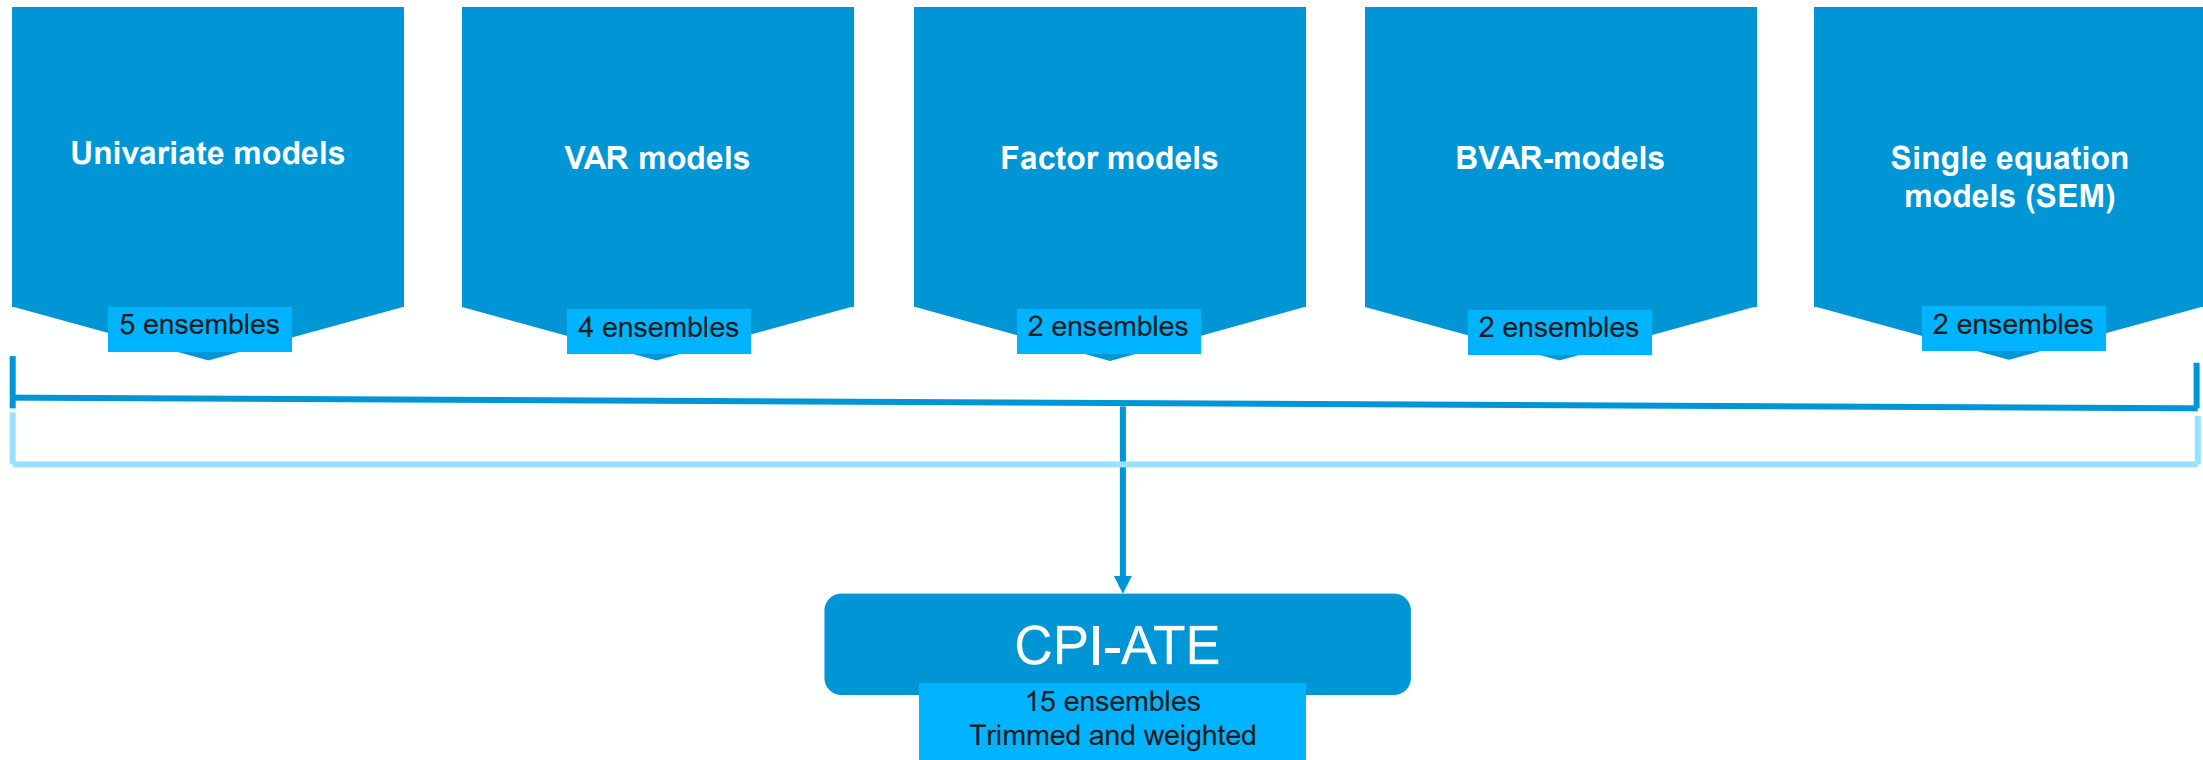

Weighting
Weight up the best
models

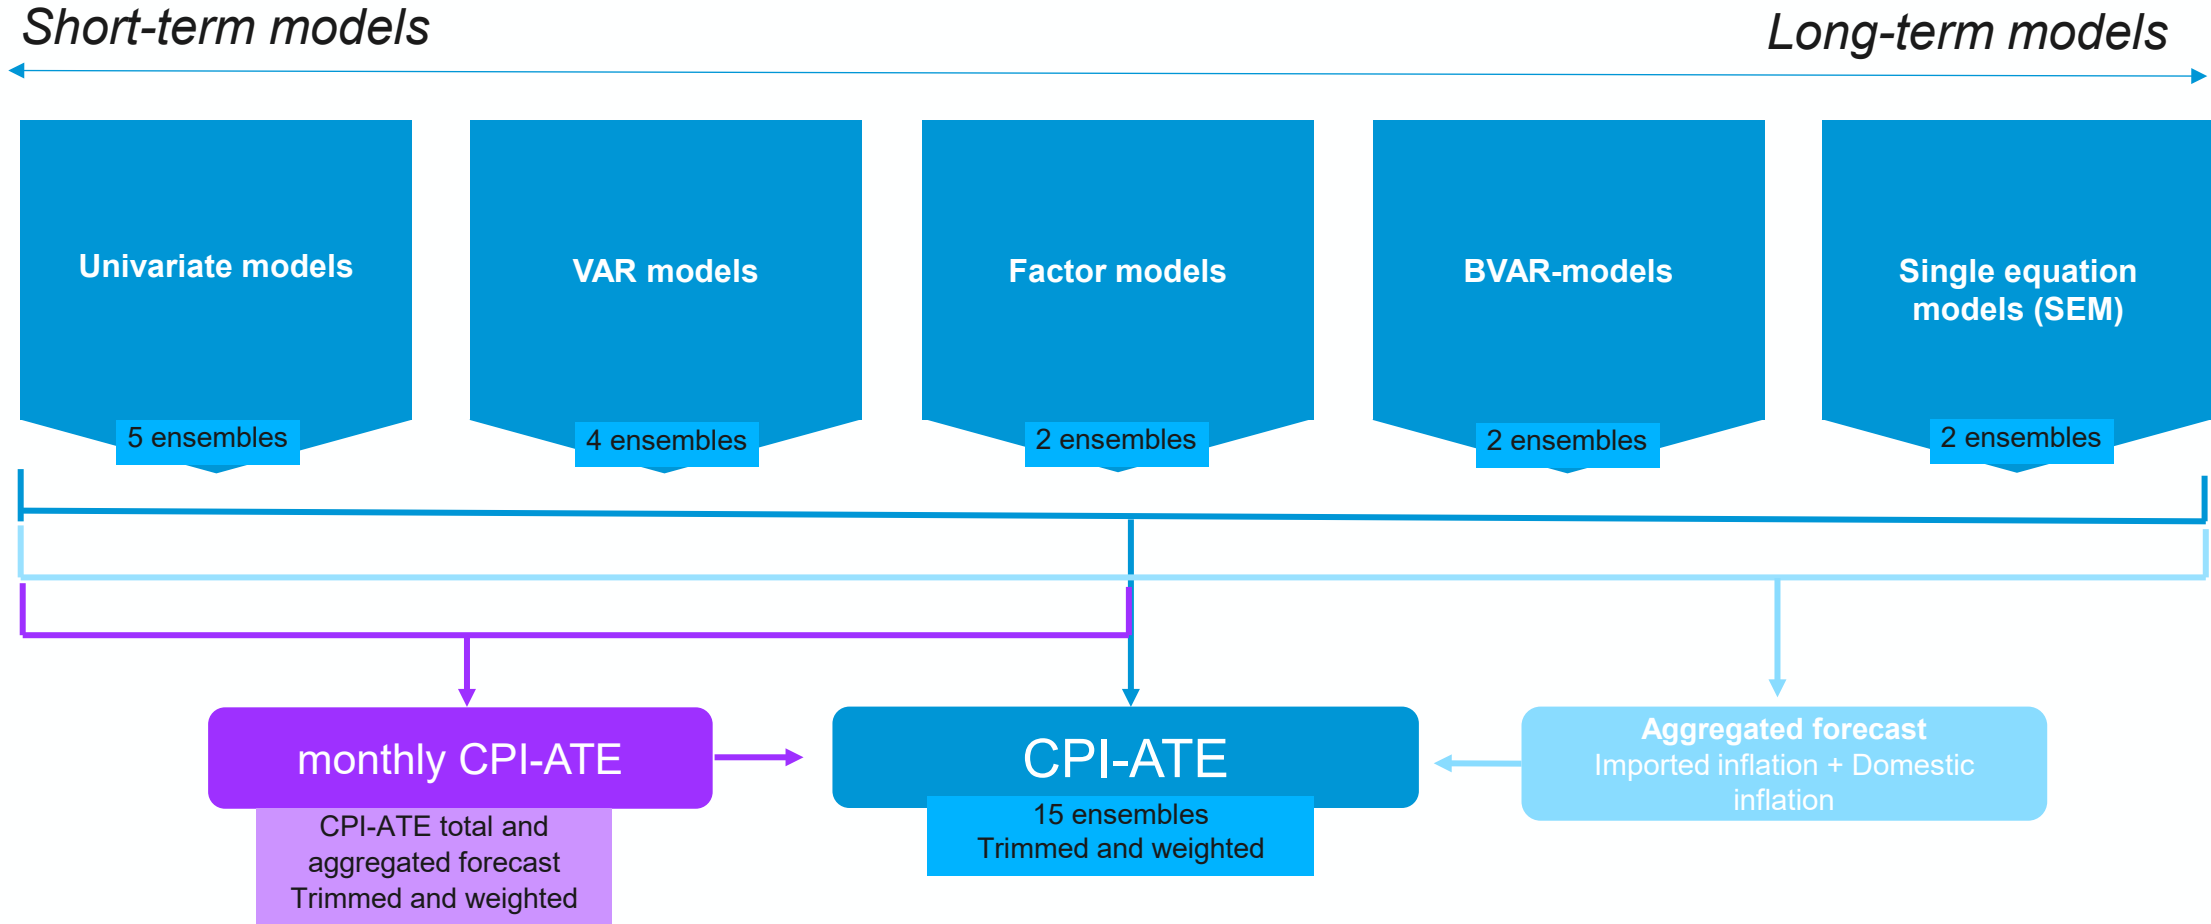

Discounting
Models that did well
lately get higher
weights

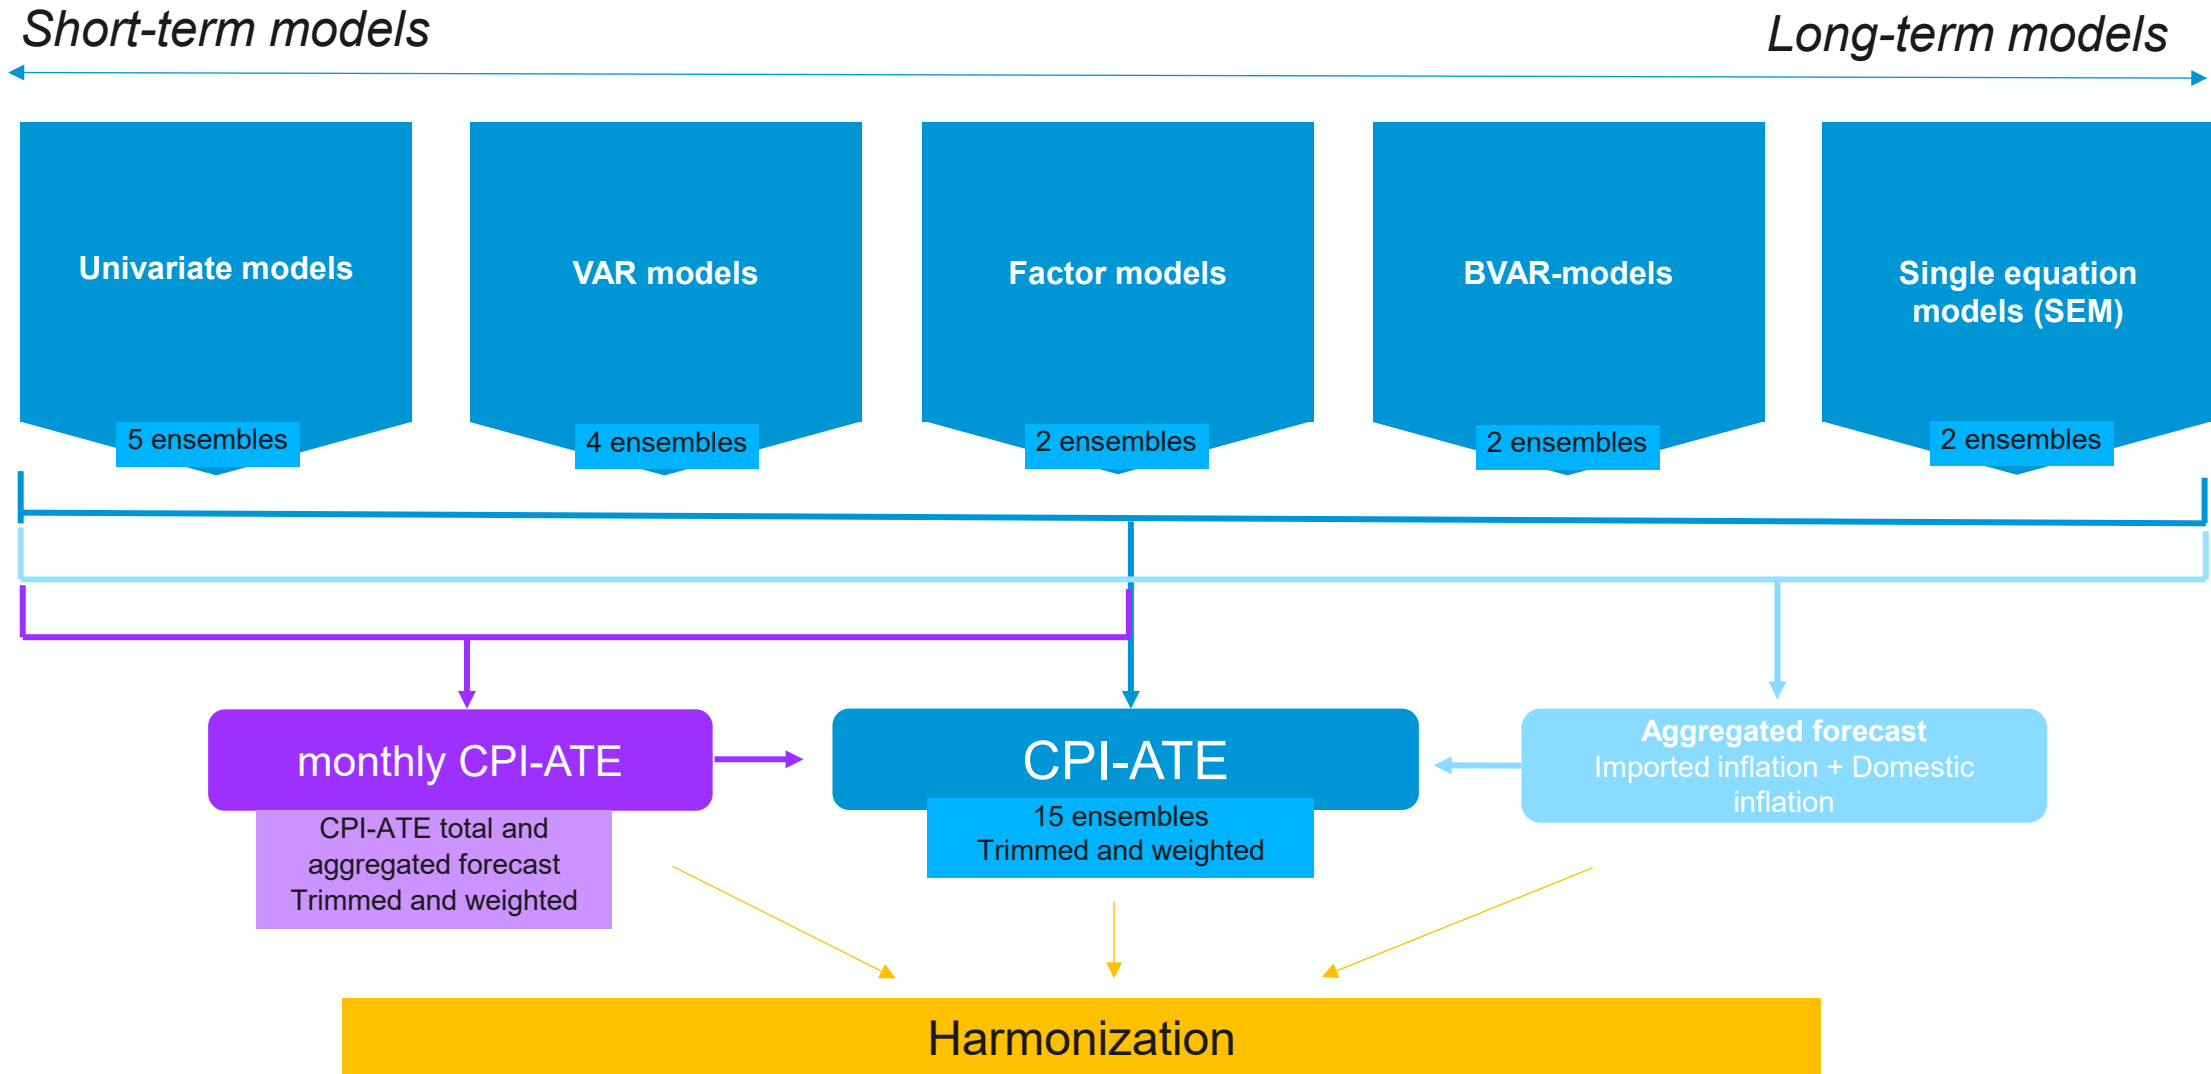

SMART inflation

SMART inflation

SMART inflation

SMART in practice

Forecasting process in Norges Bank

1. Staff workshops and seminars
2. Bringing the forecasts to the MPC
3. External communication

Sector expert judgment on SMART

Inflation

Sector expert judgment on SMART

Inflation

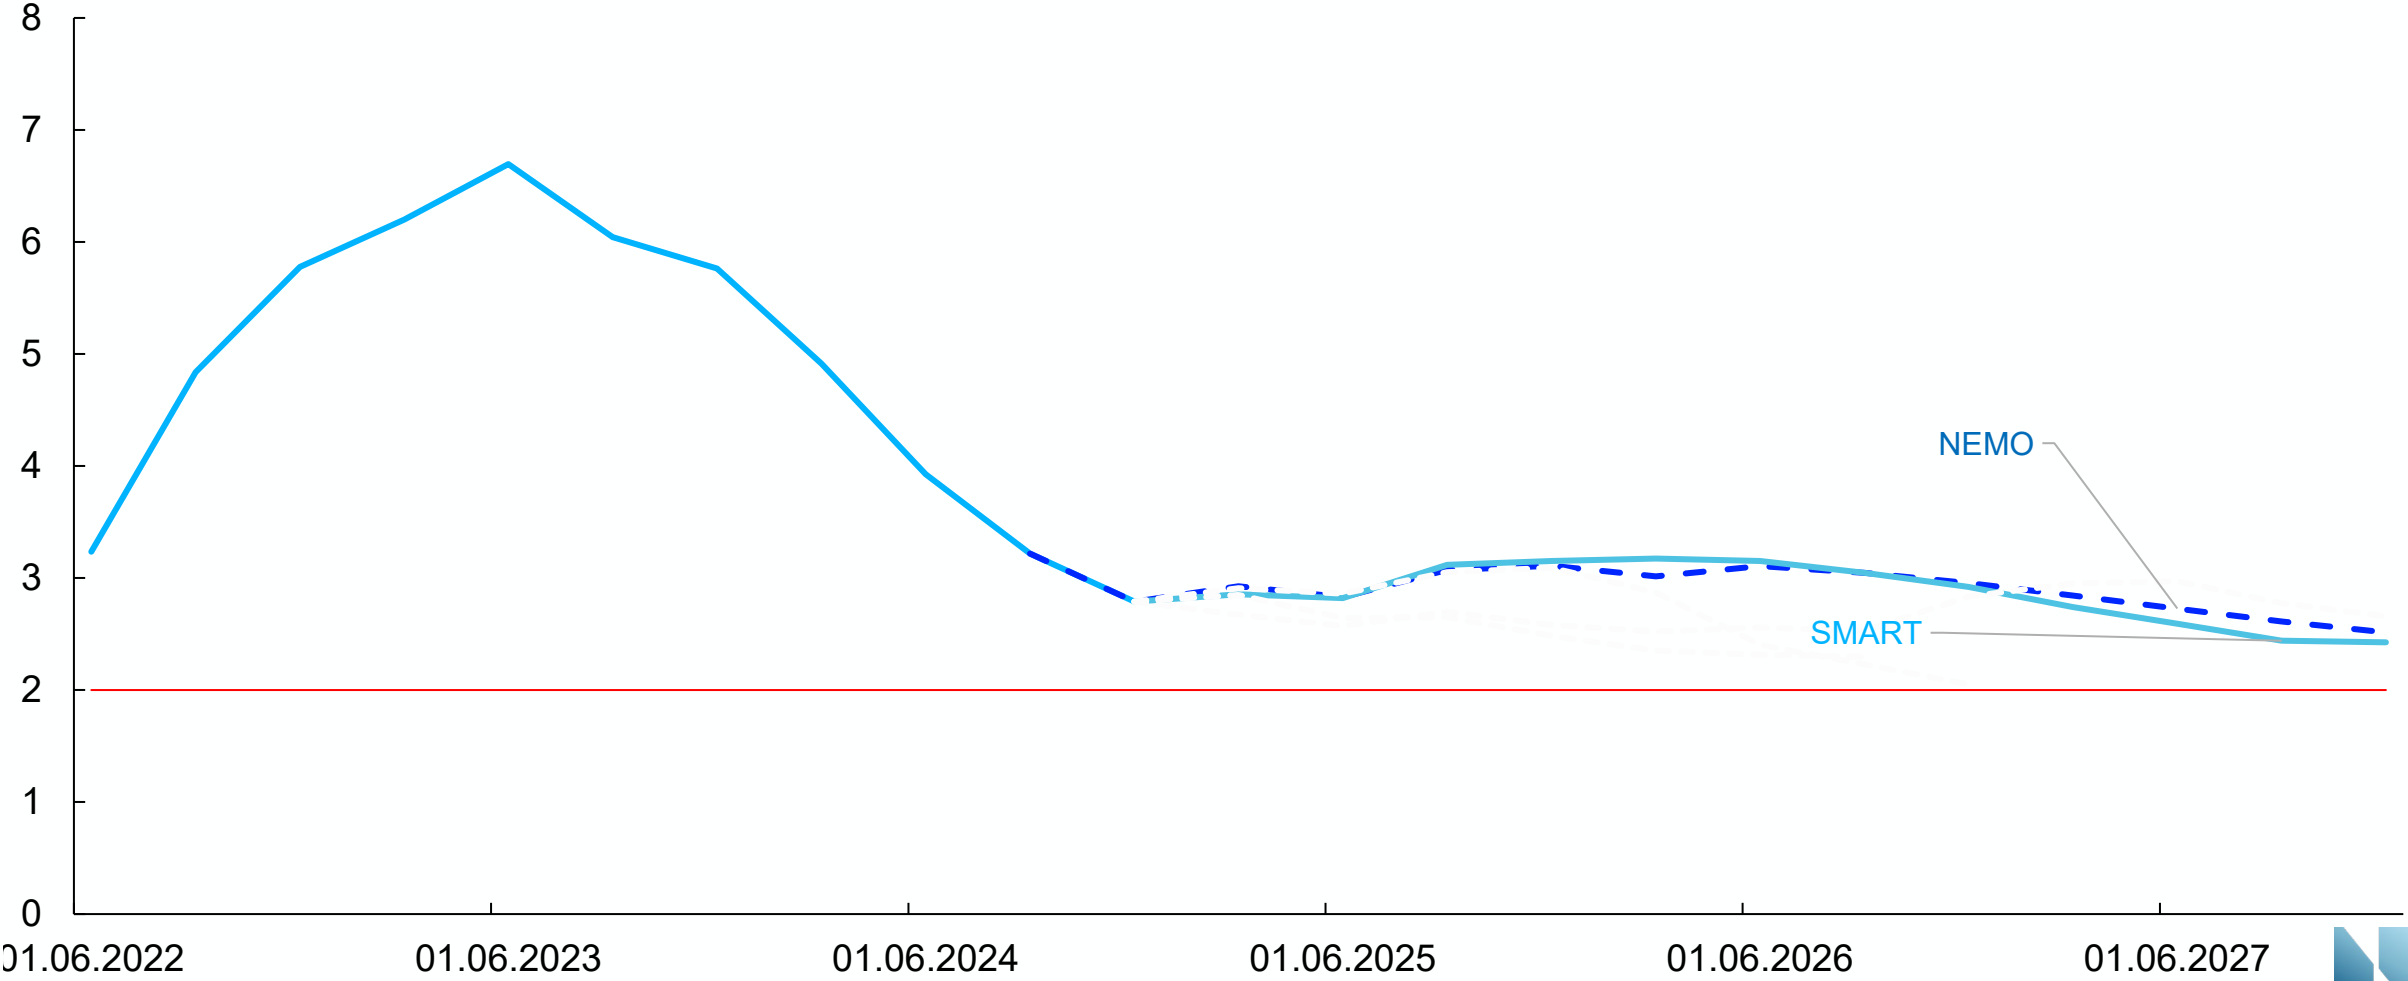

Sector expert judgment on SMART

Food inflation

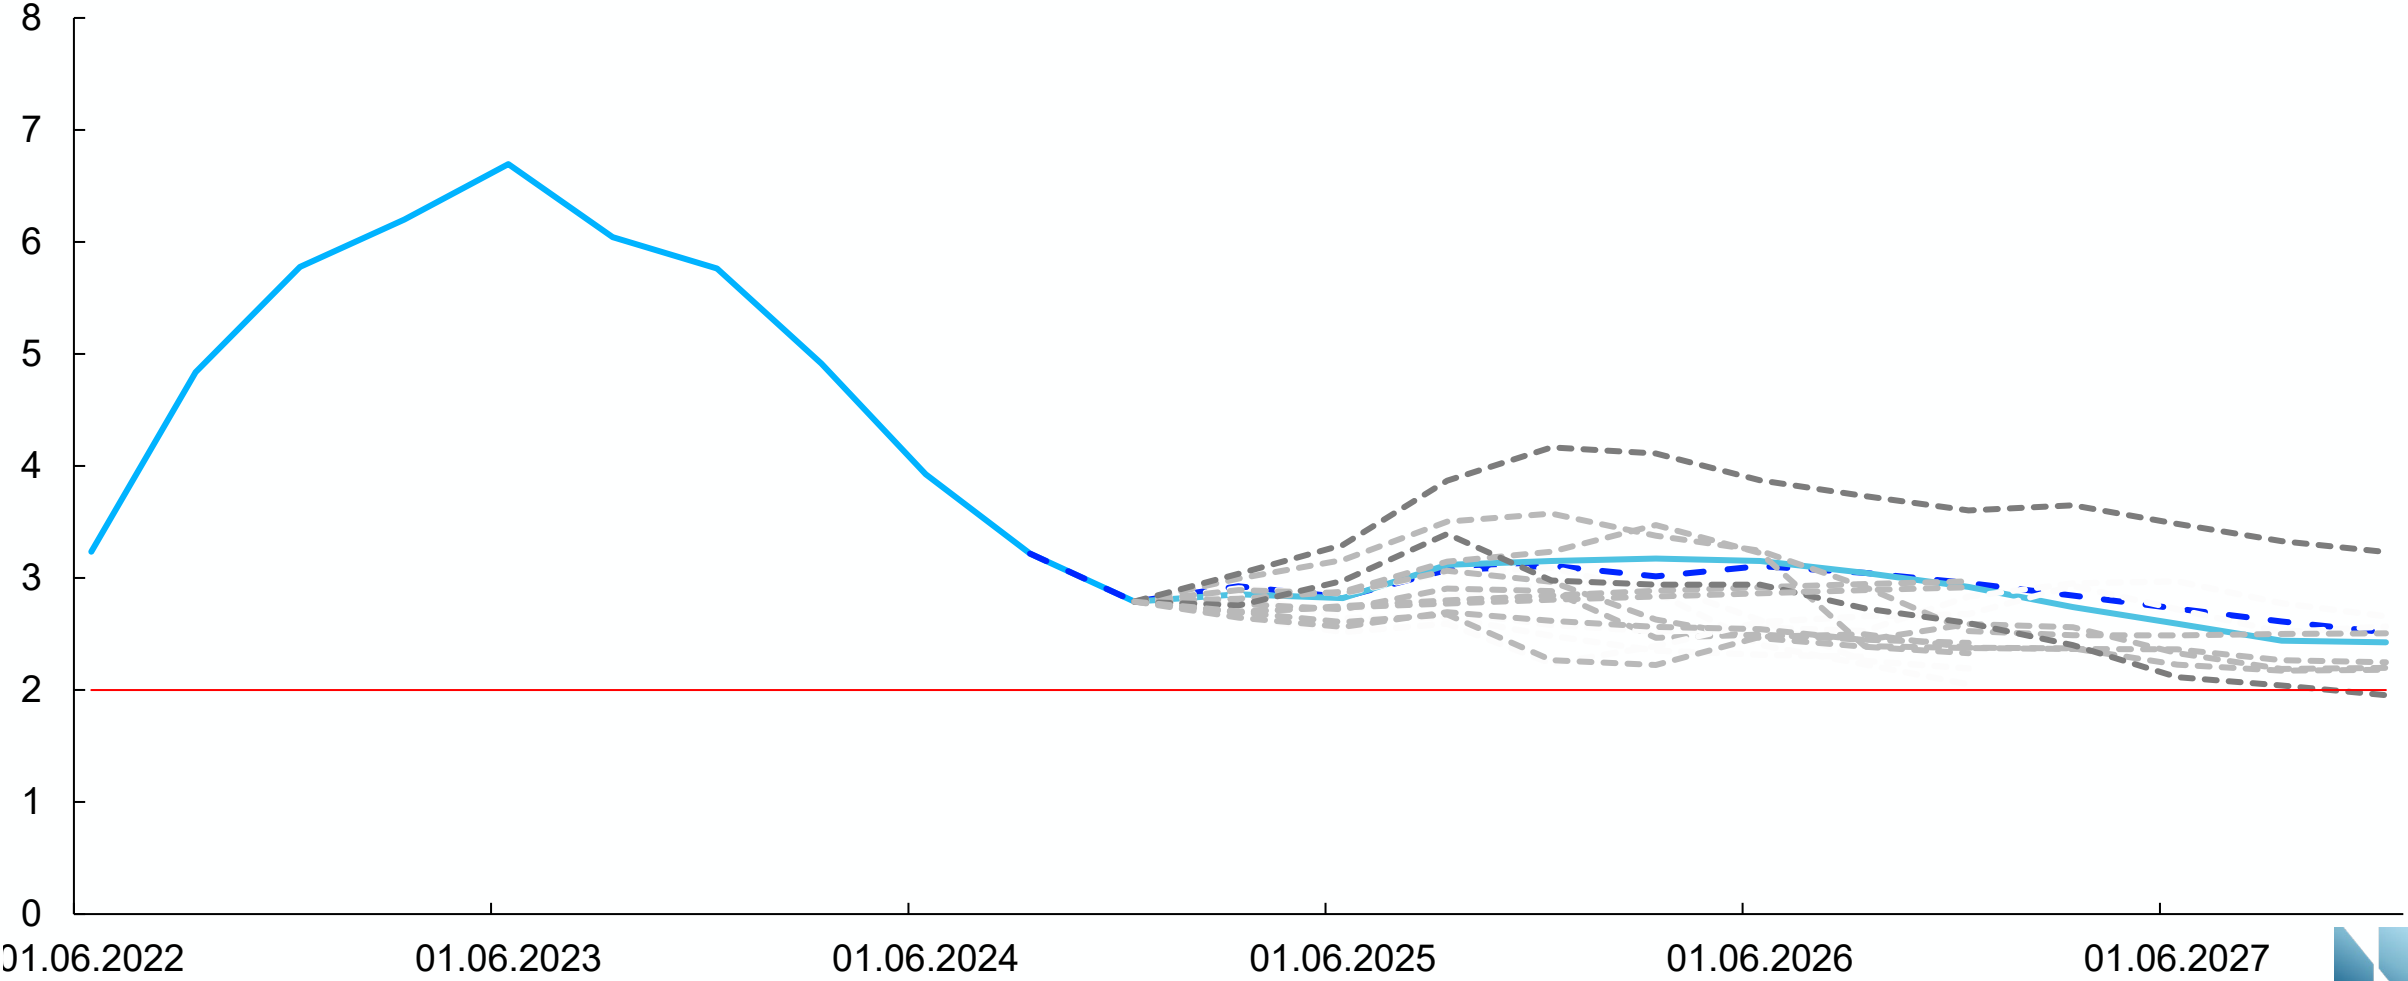

Crosscheck of NEMO forecasts

Inflation

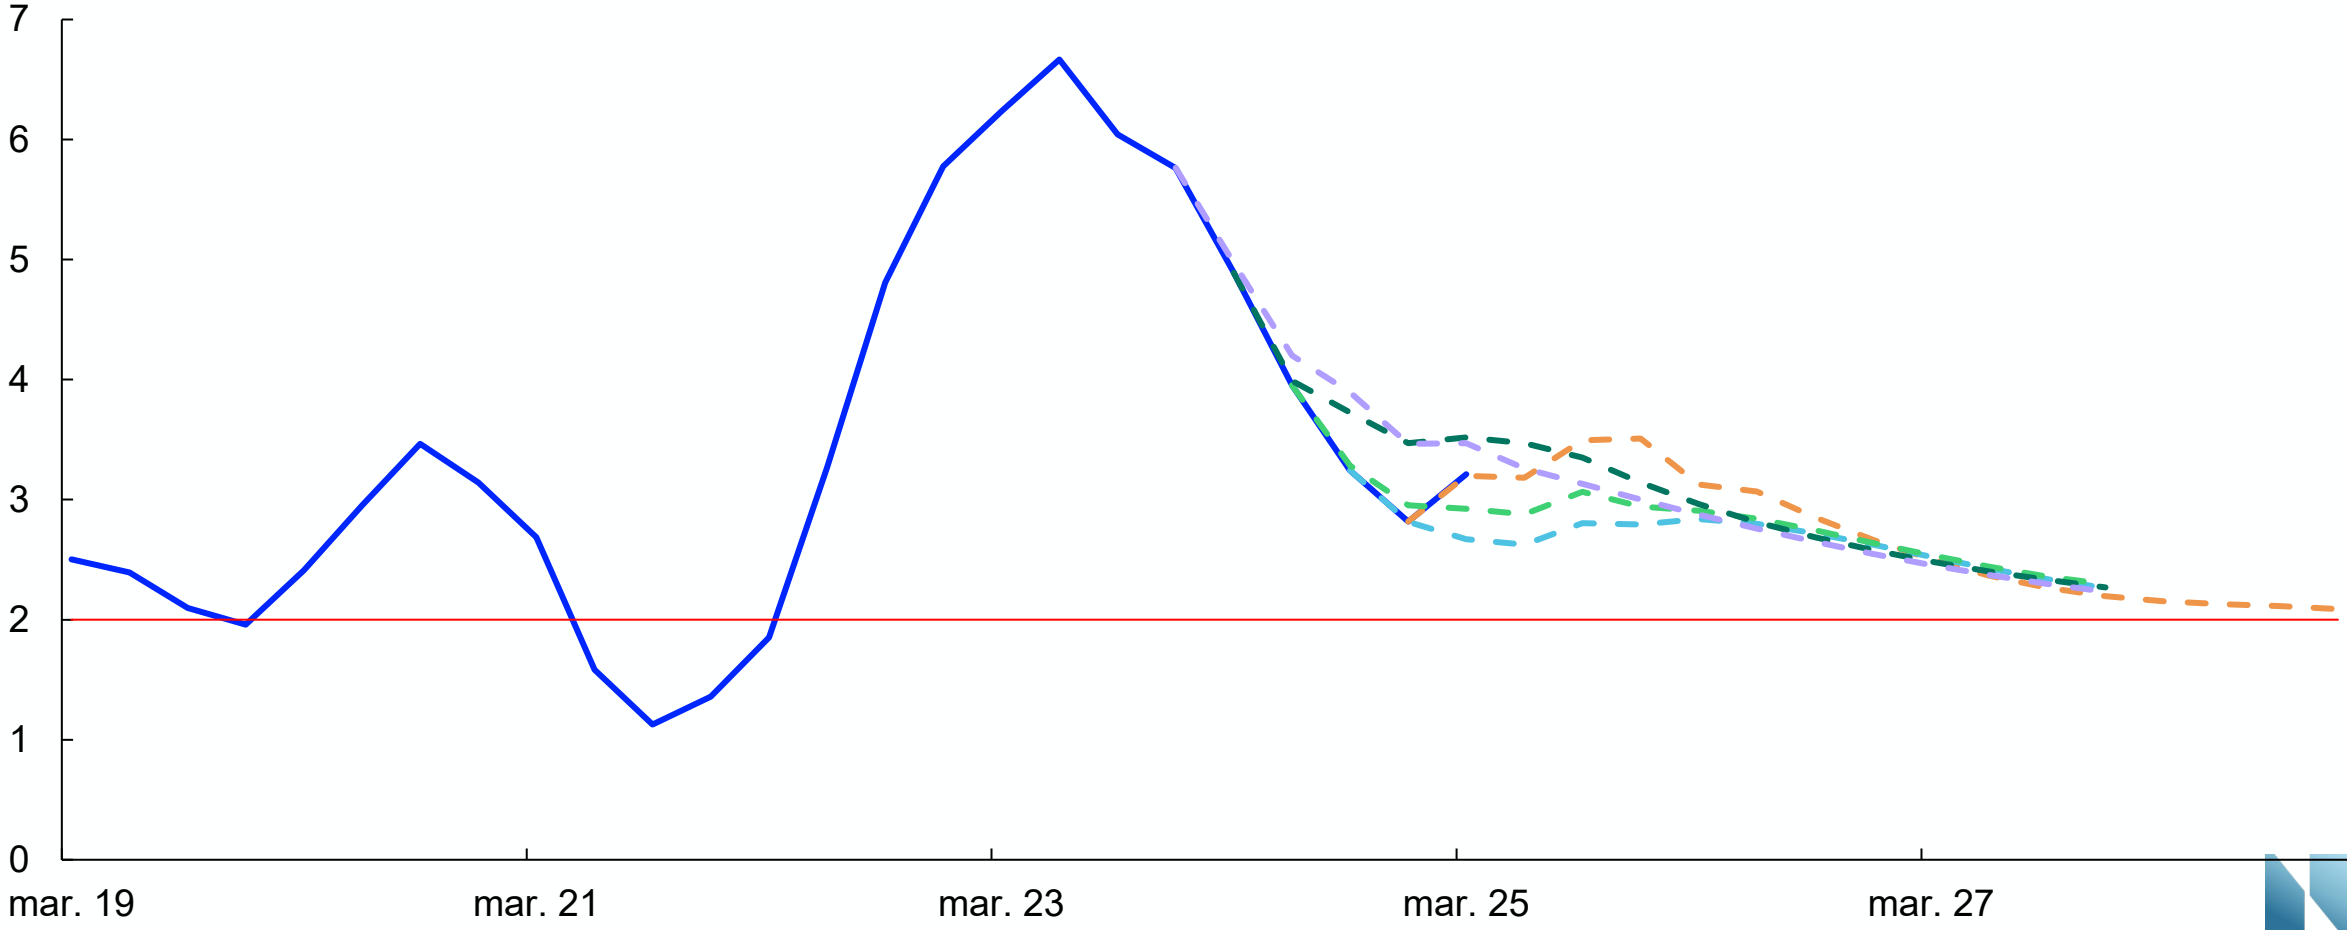

Crosscheck of NEMO forecasts

Inflation

Large misses in the short run, but same forecast in the medium run

Inflation

Momentum from SMART stable and above target

Average quarterly inflation rate over the forecast horizon

Higher than in 2022

Average quarterly inflation rate over the forecast horizon

And close to target before the pandemic

Average quarterly inflation rate over the forecast horizon

New inflation data during the MPR-process

New inflation data during the MPR-process

New inflation data during the MPR-process

External communication

Core cpi-inflation. Four-quarter change. Percent

What are we working on now?

- Building more SMART - systems
 - Inflation and GDP well established
 - Labor market, house prices, consumption ++ under development
- Exploring new data and methods
 - Microdata on consumption, prices and the labor market
 - Applying new machine learning techniques
 - Model combination
- Visualization and dashboards
