# Monetary Policy Report fan charts August 2022

The charts and tables in this document show the MPC's fan charts as described in Section 1 of the August 2022 Monetary Policy Report. They are based on a number of conditioning assumptions that are set out in more detail in the 'Conditioning assumptions, forecast summary, and indicative projections' document.

The charts and tables showing the August 2022 projections have been conditioned on: Bank Rate following a path implied by market yields (unless otherwise stated); the Term Funding Scheme and Term Funding Scheme with additional incentives for Small and Medium-sized Enterprises; the Recommendations of the Financial Policy Committee and the current regulatory plans of the Prudential Regulation Authority; the Office for Budget Responsibility's assessment of the Government's tax and spending plans as set out in Spring Statement 2022 and the May Cost of Living Support package; commodity prices following market paths for six months, then held flat; the sterling exchange rate remaining broadly flat; and the prevailing prices of a broad range of other assets, which embody market expectations of the future stocks of purchased gilts and corporate bonds.

The data behind the distributions in August 2022, the market interest rate paths underlying some of these projections and the 'Conditioning assumptions, forecast summary, and indicative projections' document are available at '**Monetary Policy Report chart slides and data – August 2022**'.
Projection of the level of GDP (wide bands) (a) (b) (c)

£ billions (2019 prices)

Projection

ONS data

2018 | 19 | 20 | 21 | 22 | 23 | 24 | 25
Projection of the level of GDP (narrow bands) (a) (b) (c)
£ billions (2019 prices)

Projection

ONS data

2018 | 19 | 20 | 21 | 22 | 23 | 24 | 25

Projection of the level of GDP based on constant nominal interest rates at 1.75% (wide bands) (a) (b) (c)

£ billions (2019 prices)

Projection of the level of GDP based on constant nominal interest rates at 1.75% (narrow bands) (a) (b) (c)

£ billions (2019 prices)

Four-quarter GDP growth projection (wide bands) (a) (b)
Percentage increases in output on a year earlier

Four-quarter GDP growth projection (narrow bands) (a) (b)

Percentage increases in output on a year earlier

Four-quarter GDP growth projection based on constant nominal interest rates at 1.75% (wide bands) (a) (b)
Percentage increases in output on a year earlier

ONS data

Projection

Four-quarter GDP growth projection based on constant nominal interest rates at 1.75% (narrow bands) (a) (b)

Percentage increases in output on a year earlier
ONS data
Projection

CPI inflation projection (wide bands) (a) (b)

Percentage increase in prices on a year earlier

CPI inflation projection (narrow bands) (a) (b)
Percentage increase in prices on a year earlier

CPI inflation projection based on constant nominal interest rates at 1.75% (wide bands) (a) (b)

Percentage increase in prices on a year earlier

Projection

CPI inflation projection based on constant nominal interest rates at 1.75% (narrow bands) (a) (b)

Percentage increase in prices on a year earlier

Projection

Projected probabilities of CPI inflation in 2023 Q3 (central 90% of the distribution) (a) (d)

August — May

Probability density (per cent)
Projected probabilities of CPI inflation in 2024 Q3 (central 90% of the distribution) (a) (d)

August — May

Probability density (per cent)
Inflation probabilities relative to the target (e)

Probability of inflation at or below
the target, inverted (per cent)

Probability of inflation
above the target (per cent)
Probability that two year ahead inflation will be above the target from successive Monetary Policy Report projections (f)

Probability (per cent)

Projected cumulative probabilities of CPI inflation in 2024 Q3 (g)

⬛🟧 **August**   ⎯⎯ **May**

Probability (per cent)
Unemployment rate projection (a) (b) (h) (i)

Unemployment rate (per cent)

Projection

2018 19 20 21 22 23 24 25
Unemployment rate projection based on constant nominal interest rates at 1.75% (a) (b) (h) (i)

Unemployment rate (per cent)

Projection

2018 19 20 21 22 23 24 25
Endnotes

(a)   The fan charts and associated cross-sections depict the probability of various outcomes for GDP, CPI inflation or the unemployment rate. In the GDP fan chart, the distribution to the left of the shaded area reflects uncertainty around revisions to the data over the past. To aid comparability with the official data, it does not include the backcast for expected revisions, which is available at '**Download the chart slides and data – August 2022**'. Over the forecast period, the distribution reflects uncertainty over the evolution of GDP, CPI inflation or the unemployment rate in the future. If economic circumstances identical to today's were to prevail on 100 occasions, the MPC's best collective judgement is that CPI inflation, the unemployment rate or the mature estimate of GDP would lie within the darkest central band on only 10 of those occasions in the narrow-band fan charts and 30 of those occasions in the wide-band fan charts. The fan chart is constructed so that outturns are also expected to lie within each pair of the lighter coloured areas on 10 (narrow bands) and 30 (wide bands) occasions. In any particular quarter of the forecast period, GDP, CPI inflation or the unemployment rate are therefore expected to lie somewhere within the fan on 90 out of 100 occasions. And on the remaining 10 out of 100 occasions they can fall anywhere outside the coloured area of the fan chart. Over the forecast period, this has been depicted by the shaded area marked as projection. In any quarter of the forecast period, the probability mass in each pair of identically coloured bands sums to 10% (narrow bands) and 30% (wide bands). See the box on pages 48–49 of the May 2002 Inflation Report for a fuller description of the fan chart and what it represents.

(b)   The shaded areas marked as projection in the GDP, CPI inflation and unemployment fan charts show the forecast period.

(c)   Chained-volume measure (reference year 2019). The width of this fan over the past has been calibrated under the assumption that revisions to GDP are independent of the revisions to previous quarters. This calibration also takes account of the likely path dependency of the economy, where, for example, it is judged that shocks to GDP in one quarter will continue to have some effect on GDP in successive quarters.

(d)   Cross-sections of the fan charts. The figures on the y-axis indicate the probability of CPI inflation being within ±0.05 percentage points of any given growth rate, specified to one decimal place; figures are average probability within each band.

(e)   Assessed probabilities of inflation relative to the target in each quarter of the forecast period. The 5 percentage points width of the swathes reflects the fact that there is uncertainty about the precise probability in any given quarter, but they should not be interpreted as a confidence interval.

(f)   Probability of above-target inflation at the respective two-year points of each Monetary Policy Report forecast based on successive market rate projections with the exception of August 2013 which shows the constant rate projection. Prior to November 2019, the Monetary Policy Report was called the Inflation Report.

(g)   Probability of CPI inflation being at or below different points.

(h)   LFS measure. The calibration of this projection takes account of the likely path dependency of the economy, where, for example, it is judged that shocks to unemployment in one quarter will continue to have some effect on unemployment in successive quarters. 2022 Q2 is a staff projection for the unemployment rate, based in part on data for April and May.

(i)   Over the forecast period, a significant proportion of this distribution lies below Bank staff's current estimate of the long-term equilibrium unemployment rate. There is therefore uncertainty about the precise calibration of this fan chart.
